

DEVITLTD. Event Management System

Complete MERN Stack Project Documentation

Developed By: **Heli & Meet Patel**

1. Project Overview

DEVIT EVENT is a full-stack Event Management and Reservation Platform developed using the MERN Stack. The platform connects event organizers and attendees through a responsive and user-friendly web application.

Organizers can create events, manage ticket categories, track bookings, and monitor revenue analytics. Users can browse events, filter by category or city, book tickets, and receive confirmation emails with QR-based digital passes.

The system includes secure JWT authentication, MongoDB cloud storage, backend validation, and responsive dashboards.

Home Page

This screen represents the main landing page of the application.

Users can browse available events, search events, filter by city and category, and view event cards with pricing and booking options.

This page acts as the main entry point for attendees.

Login Page – User Authentication Interface

This screen handles secure user login and authentication.

Users enter email and password. The backend verifies credentials using BCrypt and generates a JWT token. After successful login users are redirected based on role:

- User
- Organizer
- Admin

Organizer Dashboard

This dashboard helps organizers manage events and monitor analytics.

Organizers can:

Create events

Edit details

Manage ticket pricing

View attendees

Track bookings and revenue

Analytics cards display live performance insights.

Admin Dashboard

This panel is designed for system administration.

Admins can :

Manage users

Review events

Delete listings

Reset bookings

Monitor overall platform activity

MongoDB Collections

MongoDB Atlas stores data in collections.

Users:

- name
- email
- password
- role

Events:

- title
- pricing
- location
- date
- seats

Bookings:

- quantity
- ticket type
- total price

This provides secure and scalable storage.

VS Code Folder Structure

This screenshot shows the project structure inside Visual Studio Code.

Frontend:

- components
- pages
- routes
- store

Backend:

- config
- controllers
- middleware
- models
- routes
- services

This modular structure improves maintainability.
